Experiment 10

10.1.2 Reverse String

Algorithm :

Step 1 : Start
Step 2 : Input string and store in user_string
Step 3 : Set result as an empty string
Step 4 : Find length of user_string and store in l
Step 5 : Set i = l - 1
Step 6 : Repeat steps while i is greater than or equal to 0
Step 7 : Get the character at index i from user_string
Step 8 : Add the character to result
Step 9 : Decrease i by 1
Step 10 : Go back to Step 6
Step 11 : Print result
Step 12 : Stop

Flowchart :

Start
INPUT
user_input
CALL
reverse string(user_input)
PRINT
user_input
,result
Stop
Start
set result = “”
l =
length(user_input
i = l - 1
i > -1
False
True
i -= 1
result
+=user_input[i]
Return result
Stop

Code :

```
def reverse_string(strl):
    res = ""
    ln = len(strl)
    for i in range(ln-1,-1,-1):
        res=res+strl[i]
    return res
user_input = input("Enter a string: ")
result = reverse_string(user_input)
print(f"Original String: {user_input}")
print(f"Reversed String: {result}")
```

10.1.2. Reverse a String

08:22

Write a Python program that prints the reverse of a given input string. The program uses a **reverse_string()** function that takes a string as input and returns its reversed string.

Input Format:

- The program prompts "Enter a string: " and reads a string representing the string to be reversed.

Output Format:

- The first line prints the original string, in the format:

```
Original String: <input_string>
```

- The next line prints the reversed string, in the format:

```
Reversed String: <reversed_string>
```

```python
def reverse_string(strl):
    res = ""
    ln = len(strl)
    for i in range(ln-1,-1,-1):
        res=res+strl[i]
    return res
user_input = input("Enter a string: ")
result = reverse_string(user_input)
print(f"Original String: {user_input}")
print(f"Reversed String: {result}")
```
